bracepaste®
bonding products

bracepaste®
a d h e s i v e

"BracePaste has a very predictable and familiar feel to it. There's minimal drift and I'm saving time with the quick and easy flash cleanup. It was a seamless transition from my previous adhesive and I've had no issues incorporating it into my practice."

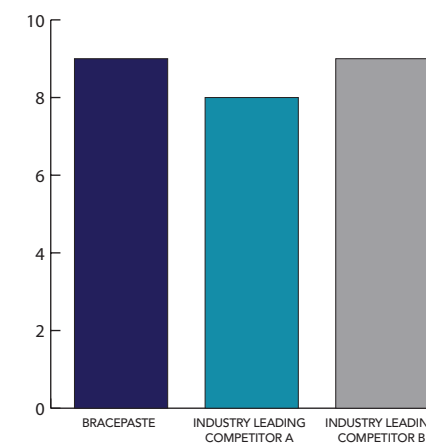

BRACEPASTE AND BRACEPASTE COLOR CHANGE

BracePaste® medium viscosity adhesive provides optimum bonding of metal and ceramic brackets. It is designed to minimize bracket drift and provide easy flash clean up. Upon light cure, the bracket is ready for immediate tie in of arch wires. The adhesive is compatible with most other light cure orthodontic sealants and bond enhancers. It offers consistent fluorescence under UV light for enhanced adhesive cleanup.

BracePaste Color Change has the same familiar feel and workability of BracePaste but its purple color turns translucent upon curing for ease of clean up and enhanced placement of brackets.

Adhesive Bond Strength (MPa)

BRACEPASTE BAND AND BUILD LC

American Orthodontics also offers BracePaste Band and Build LC. This fluoride releasing, light cure band cement adds another option for orthodontists within the BracePaste product family.

The blue color of BracePaste Band and Build LC allows for easy clean up. BracePaste Band and Build LC provides optimum bonding of molar bands and will not wear on opposing enamel. It is a single paste system with no mixing required and no working time constraints.

BRACEPASTE MTP PRIMER

BracePaste Moisture Tolerant Primer excels in hard-to-control moisture areas and is also a time saver as there is no need to dry after rinsing etch. BracePaste Moisture Tolerant Primer is compatible with most other light cure adhesives and bond enhancers.
